                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Included in the invention is a vector containing the CMRP CDNA, and a host cell transformed with the vector. The host cell (a microorganism, Corynebacterium or Brevibacterium, moss or algae or a plant cell) is useful for producing a fine chemical such as carbohydrates, cofactors and/or enzymes. The nucleic acid molecules are suitable for modifying a carbohydrate production system in a host, e.g., microorganisms and enzymes in other species which are useful to modify the blosynthesis of starch, cell wall polysaccharides and sugars. The nucleic acid molecules may be utilised in the genetic engineering of Corynebacterium glutamicum and the
                                                                                                 This invention relates to nucleic acid molecules AAH88708 - AAH88796 isolated from Physcomitrella patens (a moss), which encode carbohydrate metabolism related proteins (CMRP) represented in AAM00022 - AAM00110.
                                                                                                                                                                  Novel moss nucleic acid molecules encoding a carbohydrate metabolis related protein useful for modulating production of fine chemicals as carbohydrates, cofactors and enzymes from microorganisms and pla
                                                                                                                                                                                                                                                                                                   14-DEC-2000; 2000WO-EP12697.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         make it a better or more efficient producer of one or more fine chemicals. Mutagenesis of one or more CMRPs may also result in CMRPs having altered activities which indirectly impact the production of one or more desired fine chemicals from plants. Primers AAH88705 - AAH80707 are used in the sequencing of the CMRP cDNA sequences of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence
                                                                                                                                                        A gene encoding tick salivary gland antigen - uprotecting animals from tick-carried infections
                                                                     The present sequence represents a tick salivary gland antigen related immunogen. The present invention also describes a tick derived sering protease and a tick derived cysteine protease. A nucleotide sequence encoding any of the above proteins can be used in a vaccine against tick carried infections for domestic animals such as cattle.
                                                                                                                                                                                        WPI; 2000-296340/26.

This invention relates to nucleic acid molecules AAH88708 - AAH88796 isolated from Physcomitrella patens (a moss), which encode carbohydrate metabolism related proteins (CMRP) represented in AAM00022 - AAM00110. Included in the invention is a vector containing the CMRP cDNA, and a host cell transformed with the vector. The host cell (a microorganism, corynebacterium or Brevibacterium, moss or algae or a plant cell) is useful for producing a fine chemical such as carbohydrates, cofactors and/or enzymes. The nucleic acid molecules are suitable for modifying a

that encodes hemocyanin (II), a domain of (I) or its fragment with the immunological properties of at least one domain of (II). The products (the invention have cytostatic, virucide, antibacterial, antiparasitic, immunomodulatory and antihypertensive activity. (I), and constructs additionally containing antigen-encoding sequences, are useful in gene therapy of tumors. Polypeptides encoded by (I) are useful for treating parasitic or viral infections and tumors, particularly schistosomiasis and carcinoma (of bladder, epithelium, ovary, breast, bronch or colon-rectum), also hypertension, as vaccines, for treating cocaine misuse and very generally as carriers for pharmaceuticals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         carbohydrate production system in a host, e.g., microorganisms and plants. They are also useful to identify those DNA sequences and enzymes in other species which are useful to modify the biosynthesis of starch, cell wall polysaccharides and sugars. The nucleic acid molecules may be utilised in the genetic engineering of Corynebacterium glutamicum and the related Brevibacteium species and Acetobacter xylinum and Chlorella to make it a better or more efficient producer of one or more fine chemicals. Mutagenesis of one or more CNRPs may also result in CNRPs having altered activities which indirectly impact the production of one or more desired fine chemicals from plants. Primers AAH88705 - AAH80707 are used in the sequencing of the CNRP cDNA sequences of the invention.

                                       This invention describes a novel nucleic acid molecule (N1) encoding hemocyanin, a hemocyanin domain, or a functional fragment of it with the immunological properties of at least one domain of hemocyanin, and which comprises at least one intron is new. The products of the invention have cytostatic and vasotropic activity and can be used in vaccines or for gene therapy. Compositions comprising nucleic acids of the invention are useful in treating tumors. Compositions comprising hemocyanin polypeptide are useful in treating parasite and viral infections and as an antitumor agent. It is also useful in treating abnormal blood pressure, bladder carcinomas, epithelial carcinomas, ovarian carcinomas, anamany carcinomas, bronchial carcinomas, and colon carcinomas. It may also be used to cure cocating additions.
                                                                                                                                                                                                                                                       Claim

They may also be used to generate antibodies (Ab). Probes based on (I) and Ab are useful for detecting tumor-specific DNA in a cel (by detecting specific binding to cellular DNA or proteins), particularly where associated with the types of carcinoma listed above. Hemocyanins can be produced recombinantly, relatively inexpensively and in adequate amounts, eliminating the need to culture gastropods. When used as a carrier, (II) significantly increases the half-life of the attached pharmaceutical, by inhibiting ultrafiltration in the kidneys.

                                                                                                                                                               additionally containing antigen encoding sequences, are useful in gene therapy of tumors, polypeptides encoded by (1) are useful for treating parasitic or viral infections and tumors, particularly schistosomiasis and carcinoma (of bladder, epithelium, ovary, breast, bronchi or colon-rectum), also hypertension, as vaccines, for treating cocaine misuse and very generally as carriers for pharmaceuticals, e.g. cytostatics. They may also be used to generate antibodies (Ab). Probes based on (1) and Ab are useful for detecting tumor-specific DNA in a cell (by detecting specific binding to cellular DNA or proteins), particularly where associated with the types of carcinoma listed above. Hemocyanins can be produced recombinantly, relatively inexpensively and in adequate amounts, eliminating the need to culture gastropods. When used as a carrier, (II) significantly increases the half-life of the attached pharmaceutical, by inhibiting ultrafiltration in the kidneys.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            tumor; parasite infection; viral infection; antitumor agent; abnormal blood pressure; bladder carcinoma; epithelial carcinoma; ovarian carcinoma; mammary carcinoma; bronchial carcinoma; colon carcinoma; cocaine addiction.
                                                                                                                    This invention describes a novel nucleic acid molecule (NI) encoding hemocyanin, a hemocyanin domain, or a functional fragment of it with the immunological properties of at least one domain of hemocyanin, and which comprises at least one intron is new. The products of the invention have cytostatic and vasotropic activity and can be used in vaccines or for gene therapy. Compositions comprising nucleic acids of the invention are useful in treating tumors. Compositions comprising hemocyanin polypeptide are useful in treating parasite and viral infections and as an antitumor agent. It is also useful in treating abnormal blood pressure, bladder carcinomas, petithelial carcinomas, ovarian carcinomas, mammary carcinomas, bronchial carcinomas, and colon carcinomas. It may also be used to cure cocaine addiction.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     M. crenulata KLH2 domain c'

The products of the invention have cytostatic and vasotropic activity and can be used in vaccines or for gene therapy. Compositions comprising nucleic acids of the invention are useful in treating tumors. Compositions comprising hemocyanin polypeptide are useful in treating parasite and viral infections and as an antitumor agent. It is also useful in treating abnormal blood pressure, bladder carcinomas, epithelial carcinomas, ovarian carcinomas, mammary carcinomas, bronchial carcinomas, and colon carcinomas. It may also be used to cure cocaine addiction.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Transferrin binding protein 1 (Tbp1) (AAW04867) of Actinobacillus pleuropneumoniae (App) strain 1370, derived from strain Hpn·1 (ATCC 27088) of serotype 1, is probably a transmembrane protein that serves as a channel for transport of iron across the outer membrane. Its amino acid sequence was deduced from a gene (AAT38071) obtd. from App genomic DNA. Recombinant Tbp1, or its antigenic fragments, can be produced in transformed host cells. It is used to formulate vaccines against porcine pleuropneumonia, to prepare antibodies (useful for serotherapy) and to prepare
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Actinobacillus pleuropneumoniae transferrin binding protein 1 - production of antibodies useful diagnostically and in universal vaccine against porcine pleuropneumonia
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            WPI; 1996-427056/43.

                                                                                                                                                                                                                           This polypeptide comprises an active truncated form of the novel tumour suppressor protein SSecKs that is a substrate of protein Standard Can Anhibitor of the transformed phenotype. Its amino acid sequence was deduced from a partial cDNA clone (see AAVO2301) obtained from SC NIH373 cells. The full-length SSeCKS sequence (see AAWO2301) is also provided. Full-length SSeCKS uncleic acid (see AAVO2301) as well as composited proteins encoded by such nucleic acids are claimed, as are isolated proteins encoded by such nucleic acids, vectors comprising the nucleic acids, host cells, and methods of inhibiting the expression of a transformed phenotype in a host cell by introducing the nucleic acids. Introduction of a SSecKS nucleic acid or gene allowing the treatment of diseases associated with disorders of cytoskeletal structure and cellular architecture (such as Alzheimer's disease), and may be a marker for aberrancies in

This polypeptide comprises the novel tumour suppressor protein SecKs that is a substrate of protein kinase C and which acts as a conspative regulatory of mitosis and as an inhibitor of the transformed phenotype. Its amino acid sequence was deduced from an C isolated nucleic acid molecule (see AAV02302). The SecKs nucleic acid, as well as homologous and hybridising nucleic acids are claimed, as are isolated proteins encoded by such nucleic acids, cettors comprising the nucleic acids, host cells, and methods of inhibiting the expression of a transformed phenotype in a host cell by introducing the nucleic acids. Introduction of a SecKs nucleic acid or gene product into a host cell inhibits mitosis of the host cell, allowing the treatment of diseases associated with disorders of proliferation and/or with the expression of a malignant of cytoskeletal structure and cellular architecture (such as also be used to treat or identify disorders account of a self-complete control of a self-c

                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present sequence is a polypeptide encoded by one of a large number of 5'. ESTs derived from mRNAs encoding secreted proteins. The 5'. ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed CDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5'. TR is rarely included. 5'. ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5'. ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New nucleic acid that is a 5' expressed sequence tag (5' EST) for obtaining cDNAs and genomic DNAs that correspond to 5'ESTs and for diagnostic, forensic, gene therapy and chromosome mapping procedures
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       N-PSDB;

For example, N and P may be used to treat disorders associated with decreased expression by rectifying mutations or deletions in a patient's genome that affect the activity of P by expressing inactive proteins or to supplement the patients own production of P. Additionally, N may be used to produce the colon cancer-associated Ps. by inserting the nucleic acids into a host cell and culturing the cell to express the proteins. N and P can be used in the prevention, diagnosis and treatment of colorectal carcinomas and cancers. AAH37196 to AAH37204 and AAB77789 represent sequences used in the exemplification of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               N.B. Pages 666 to 682 and page 7053 of the sequence listing were missing at time of publication, meaning no sequences are present for SEQ ID NO:1027 to 1052, 7921 and 7922.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          cancer-associated nucleic acid molecules (N) and proteins (P), where the proteins are collectively known as colon cancer antigens. The colon cancer antigens have cytostatic activity and can be used in gene therapy and vaccine production. N and P may be used in the prevention, therapy and treatment of diseases associated with inappropriate P cytostatic of the prevention.

            polynucleotide coding sequences are useful for recombinant expression of the toxins and the primers, together with probes derived from the new sequences, are useful for the identification and characterisation
                                                    This is the amino acid sequence of a novel Bacillus thuringiensis toxin used in the method of the invention, to control lepidopteran pests. The new toxins are useful as pesticides, especially for the control of Ostrinia nubilalis, Heliothis virescens, and Helicoverpa zea. The

Sequences AAY04742-Y05000 and AAY07201-Y07204 represent secreted proteins from various Mycobacterium species microorganisms. The encoding nucleotide sequences can be used as primers and probes for methods for detecting and identifying mycobacteria, especially belonging to the M. tuberculosis complex. The encoded proteins can be used in vaccines for immunisation against a bacterial or viral infection.
                                                                                                                                                                                  Mycobacterial DNA vectors containing reporter constructs identifying coding or promoter sequences involved in infection-associated protein expression
                                                                                                                                                                                                                                                                     Guigueno A;

cc invention. Human secreted proteins have activities based on the tissues can decils the genes are expressed in. Examples of activities include: and cells the genes are expressive; antirheumatic; antiproliferative; cardiant; vasotropic; cerebroprotective; notropic; comeuroprotective; antibacterial; virucide; fungicide; ophthalmological; comeuroprotective; antibacterial; virucide; fungicide; ophthalmological; cand vulnerary. The polynucleotides and polypeptides can be used to prevent, treat or ameliorate a medical condition in e.g. humans, mice, crabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition or susceptibility to a condition of susceptibility to a pathological condition or susceptibility to a pathological condition or susceptibility to a condition of the susceptibility of and coular disorders. The polypeptides can also be used to aid wound healing and coular disorders. The polypeptides can also be used to supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The content of components. AAC80107 to AAC801085 and AAB45307 represent sequences used in the assemblification of the assemblification of the assemblification.
The polynucleotide sequences given in AAC81086 to AAC81134 encode the human secreted proteins given in AAB45308 to AAB45355. AAB45357 to AAB45384 represent human secreted polypeptide sequences and proteins homologous to them, which are given in the exemplification of the present invention. Human secreted proteins have activities based on the tissues
                                                      components. AAC8107 the exemplification

C anticancer and cytostatic activity. (A) are used (1) for recombinant

C expression of polypeptides (B) and (il) to isolate complete genes. (B)

CC are used (1) to identify agents suitable for treatment of uterine or

CC endometrial cancer; (il) directly for treating these forms of cancer

CC (including expression from gene therapy vectors) and (iii) for

CC (expressed sequence tags) from a particular tissue type before comparison

CC (expression patterns. This allows a significantly longer fragment of

CC the gene to be revealed, so should reduce the number of fallures

CC associated with the fact that ESTs from different libraries may represent

CC different parts of the same unknown gene, distorting the estimated

CC frequency of occurrence in a particular tissue. Axy59941-Y60328 represent

CC correct fragments encoded by the human endometrium tumour cDNA library

CC derived EST fragments represented in AxZ41981-Z42121.

CC sequence and an oligonucleotide which comprises a 5'-end CC polynucleotide which comprises a 3'-end sequence complementary to a CC polynucleotide which comprises a 3'-end sequence, where the CC oligonucleotide comprises at least 15 nucleotides and the combination of the 5'-end sequence/3'-end sequence is selected from those defined in CC the specification. The primer sets can be used in antisense therapy and CC in gene therapy. The primers are useful for synthesising polynucleotides, CC particularly full-length cDNAs. The primers are also useful for the CC detection and/or diagnosis of the abnormality of the proteins encoded by CC the full-length cDNAs. The primers allow obtaining of the full-length CC CNAs easily without any specialised methods. AAH03166 to AAH13628 and CC AAH3633 to AAH18742 represent human cDNA sequences; AAB92446 to CC AAB95893 represent human amino acid sequences; and AAH13629 to AAH13632 represent oligonucleotides, all of which are used in the exemplification CC of the present invention.
The present invention describes primer sets for synthesising 5602 full-length cDNAs defined in the specification. Where a primer set comprises: (a) an oligo-dT primer and an oligonucleotide comprises one of the complementary strand of a polynucleotide which comprises one of the 5602 nucleotide sequences defined in the specification, where the oligonucleotide comprises at least 15 nucleotides; or (b) a combination
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Primer sets for synthesizing polynucleotides, particularly the 5602 full-length cDNAs defined in the specification, and for the detection and/or diagnosis of the abnormality of the proteins encoded by the full-length cDNAs -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                       of an oligonucleotide comprising a sequence complementary to the complementary strand of a polynucleotide which comprises a 5'-end
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Claim 8; SEQ ID 16665;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                presence of an I-mf protein or analogue, or for detecting I-mf agonist activity in a test substance. The sequence can be used to treat, model and diagnose defects in myogenesis responsible for abnormal development and disease conditions in mammals, including humans. These include the human disease cleidocranial displasia (CDD), rabdomyosarcomas and other cancers affecting muscle tissue in mammals.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Disclosure; Pages
AAY34584-Y35879 represent the proteins encoded by all the open reading frames in the complete genome (see AAX91990) of Chlamydia pneumoniae. C. pneumoniae causes respiratory disease such as pneumonia and bronchitis and is thought to be a contributing factor in heart disease, sarcoidosis, sinusitis, purulent otitis media, erythema nodosum or pharyngitis. The polypeptides encoded by the open reading frames of the C. pneumoniae genome (see AAY34584-Y35879) can be used in immunogenic compositions as vaccines. Vectors containing C. pneumoniae nucleotides sequences can also be used as immunogenic compositions,
                                                                                                                                                                                                                                                                                                                                                             04-NOV-1998;

cc vulnerary; anticonvulsant; antibacterial; antirungar; autiparies. CC cardiant. The polynucleotides and polypeptides are useful for preventing, cc cardiant. The polynucleotides and polypeptides are useful for preventing, cc cardiant. The polynucleotides compared to the compared to the polypeptides cc can also be used as a food additive or preservative to increase or cc decrease storage capabilities. The polynucleotide are useful for cc chromosome identification. They are also useful as probes for diagnosing cc adisorder related to the female reproductive system, particularly breast cc and/or ovary cancer. They are also useful in the gene therapy of breast cc and/or ovary cancer. Secreted protein nucleic acids, proteins, cc antibodies, agonists and antagonists are useful in the diagnosis, cc treatment and prevention of: (a) cancer; (b) immune disorders; (c) cardiovascular disorders; (d) wound healing; (e) neurological diseases; cc and (f) infectious diseases such as viral, bacterial, fungal and cc parasitic infections. AAC74328 to AAC74336 and AAB39401 represent
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                AAB39484 represent human secreted polypeptide sequences and proteins homologous to them, which are given in the exemplification of the press invention. Human secreted proteins have activities based on the tissues and cells the genes are expressed in Example of activities include: cytostatic; immunosuppressive; nootropic; neuroprotective; antiulcer; antiallergic; hepatotropic; antidabetic; antifingal; antiparasitic; artiparasitic; artipar

This polypeptide is encoded by Mycobacterium tuberculosis antigen XR36 DNA (see AAV4421) that was isolated from a M. tuberculosis strain Erdman genomic DNA expression library using sera from patients having extrapulmonary tuberculosis. XP36 bears no similarity to known sequences. The invention relates to methods and compositions for diagnosing tuberculosis. It provides polypeptides (see AAW64291-W64379) comprising an antigenic portion a soluble M. tuberculosis antigen, or an immunogenic portion of a M. tuberculosis antigen, as well as DNA sequences encoding such polypeptides, recombinant expression vectors and transformed or transfected host cells. Also claimed are methods and diagnostic kits for detecting M. tuberculosis infection in a patient using
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New isolated Mycobacterium tuberculosis polypeptides and to develop products for the detection of M. tuberculosis and diagnosis of tuberculosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     13-MAR-1997;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes novel recombinant antigens and their encoding nucleic acids derived from Mycobacterium tuberculosis. The novel polypeptides are useful for detecting M. tuberculosis infection in a biological sample by detecting antibodies which bind with the

proteins, called prostate cancer antigens, given in AAB55363 to AAB57302. The prostate cancer antigens can have neuroprotective, cytostatic, cardioactive, immunomodulatory, muscular, vulnerary, gastrointestinal, nephrotropic, antiinfective, gynaecological and antibacterial activities, and can be used in gene therapy. The prostate cancer antigen

AAF15566 to AAF16505 encode the human prostate cancer associated

CC family of polypeptides. Host cells transfected with a vector comprising CC the HWHHJ20 nucleic acid are used for the recombinant expression of the CC polypeptide. The HWHHJ20 nucleic acid may be used as probes or primers to Screen for genetic mutations in, or alterations in the expression of the CC gene, in a patient compared to a healthy individual. This may lead to the CC diagnosis of or identification of a predisposition to diseases such as CC cancer, autoimmune diseases, asthma, rheumatoid arthritis, Alzheimer's CC disease, AIDS and stroke. Similarly measuring the amount of the CC diseases, and stroke. Similarly measuring the amount of the CC diseases. The polypeptide may be used to identify its agonists or antagonists; and to identify membrane-bound or soluble receptors. A CC fusion protein of the HWHHJ20 polypeptide and an IgG heavy chain may be used in therapy, diagnosis and drug screening. The polynucleotide is used cor for gene therapy; for determining genetic linkage, genetic variability or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              888888888x&
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        В

                                                                                                     The sequence is that of murine I-mfa (inhibitor of MyoD family) protein. Probes from the gene sequence can be used for determining presence of an I-mf protein or analogue, or detecting I-mf agonist activity in a test substance. The sequence can be used to treat, model and diagnose defects in myogenesis responsible for abnormal development and disease conditions in mammals,

Probes from the gene sequence can be used for determining the presence of an I-mf protein or analogue, or for detecting I-mf agonist activity in a test substance. The sequence can be used to treat, model and diagnose defects in myogenesis responsible for abnormal development and disease conditions in mammals, including humans. These include the human disease cleidocranial displasia (CDD), rhabdomyosarcomas and other cancers affecting

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              REPEAT REGION. THIS MECHANISM IS CALLED SLIPPED-STRAND MISPAIRING. ADDITION OR LOSS OF CCAA REPEAT UNITS WOULD CHANGE THE READING FRAME AND RESULT IN INTRODUCTION OF STOP CODONS DOWNSTREAM OF THE REPEAT REGION. THIS MAY BE A MECHANISM OF REGULATION AND A WAY TO AVOID THE INMUNOLOGICAL RESPONSE OF THE HOST.

SIMILARITY: BELONGS TO THE TONB-DEPENDENT RECEPTOR PROTEIN FAMILY; HEMOGLOBIN/HAPTOGLOBIN BINDING PROTEIN SUBPAMILY.
